

## Numericals

- 1) A plane diffraction grating has the value of grating  $15 \times 10^{-4}$  cm. Calc position of 3rd principle max. for the light of  $\lambda = 2.4 \times 10^{-4}$  cm

$$(a+b) = d = 15 \times 10^{-4} \text{ cm}$$

$$n = 3 \quad \lambda = 2.4 \times 10^{-4} \quad \text{Q}_3 = ?$$

$$(a+b) \sin \theta_n = n\lambda$$

$$\sin \theta_3 = \frac{3 \cdot \lambda}{a+b} = \frac{3 \times 2.4 \times 10^{-4}}{15 \times 10^{-4} \text{ cm}}$$

$$\sin \theta_3 = \sin^{-1}(0.28)$$

$$\theta_3 = 28.68^\circ$$

- 2) A grating has 15 cm of the surface build with 6000 lines per cm. What is the RP of the grating in 1st order.

$$L = 15 \text{ cm} \quad n = 6000 \quad n = 1$$

No of lines per cm 6000

$$RP = nN$$

$$N \geq 6000 \times L =$$

$$0 < t < \frac{\pi}{N}$$

$$\frac{\pi}{N} < t < \frac{2\pi}{N}$$

$$\frac{dy}{dx} = \frac{d^2y}{dx^2}$$

$$\frac{dy}{dx} +$$

3) Calc the possible number of orders of spectra with a plane transmission grating having 18000 lines/inch when light of wavelength 6500 Å is used.  $n = ?$   $N = 18000 \text{ lines/inch}$

$$= 18000 \text{ lines}$$

$$2.54$$

$$\lambda = 6500 \text{ Å} = 6500 \times 10^{-8} \text{ cm}$$

$$\text{By grating eqn } (a+b) \sin \theta = n \lambda$$

$$n = \frac{(a+b) \sin \theta}{\lambda}$$

$$a+b = \frac{1}{N}$$

+

$$n = \frac{\sin \theta}{\lambda}$$

The max value for  $\theta = 90^\circ$ ;  $\therefore \sin \theta = 1$ .

$$\therefore n \leq \frac{1}{\lambda}$$

$$n \leq \frac{2.54}{18000 \times 6500 \times 10^{-8}}$$

$$n \leq 3.135$$

$$\therefore \boxed{n \leq 3}$$

ii) A transmission grating has 8000 rulings/cm. The 1st order principle max due to a monochromatic source source of light occurs at an angle of  $30^\circ$ . Determine  $\lambda$  of the light.

$$N = 8000 \text{ lines/cm} \quad n = 1 \quad \theta = 30^\circ$$

$$+ ?$$

$$(a+b) \sin \theta = nd$$

$$\lambda = \frac{(a+b) \sin \theta}{n} = (a+b) \sin \theta$$

$$d = \frac{\lambda}{N} \sin \theta = \frac{\sin 30}{8000} = 8 \times 10^{-5} \text{ cm}$$

$$\lambda = 6.25 \times 10^{-5} \text{ cm}$$

$$\lambda = 625 \text{ nm}$$

5] The Na yellow double slit has a  $\lambda$  of 589 nm & 589.6 nm. What should be the resolving power of the grating to resolve these lines?

RP of grating

$$RP = \frac{1}{dd} = \frac{(d_1 + d_2)}{(d_2 - d_1)}$$

$$= \frac{(589 + 589.6) \times 10^{-9}}{(589.6 - 589) \times 10^{-9}}$$

=

6] A plane transmission grating has 10000 lines in all with grating const  $12.5 \times 10^5 \text{ cm}^{-1}$ . Calc. the max resolving power for which it can be used in the range of  $\lambda = 500 \text{ nm}$

~~Total lines over grating~~ =  $12.5 \times 10^5 \text{ cm}^{-1}$

~~Total lines over grating~~

$$= 10000$$

$$0 < t < \frac{\pi}{\nu_0}$$

$$\frac{\pi}{\nu_0} < t < \frac{2\pi}{\nu_0}$$

$$\frac{dy}{dx} = d_2$$

$$\frac{dy}{dx} +$$

classmate

Date \_\_\_\_\_

Page \_\_\_\_\_

$$(ab) = 12.5 \times 10^{-5} \text{ cm}$$

$$\text{RP} = nN = 2 \times 40000 \\ = 80000$$

$$(ab) \sin \theta = nt$$

$$n = \frac{(ab) \sin \theta}{t}$$

$$n \leq \frac{(ab) \sin \theta}{t}$$

$$n \leq \frac{(ab)}{t} = \frac{12.5 \times 10^{-5}}{500 \times 10^{-9}} = 2$$

$$\therefore RP = nN = 2 \times 40000 \\ = 80000$$

### Applications of Michelson's Interferometer

- 1) To determine wavelength of incident light

The monochromatic source of light whose wavelength is to be determined is kept at the position of the source 'S'. Let  $d_1$  be the (distance) reading of micrometer for position of  $M_1$ , micrometer. Now the position of  $M_1$  is changed so that reading of the micrometer shows  $d_2$ . At the same time no. of fringes disappearing at

3)
